

Slab ASE 01

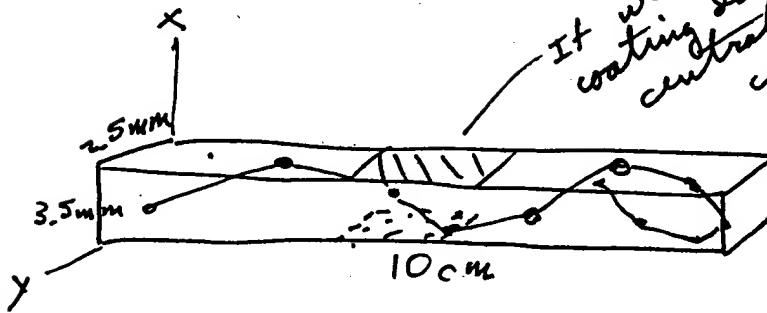

## Inputs:

10	slab length (cm)
0.35	slab height (cm)
0.25	slab thickness (cm)
1.82	slab refractive index
1.6	parasitic coating index
0.08	specific gain (nepers/cm)
100000	number of rays to launch

more than  
1000 parasitic  
rays found

## Outputs:

0.08	maximum gain (nepers/cm)
-21.9501	minimum gain (nepers/cm)

If we could apply a coating directly to a GA over the central 3 cm probably support all parasitic modes

} a kind of  
barrel mode  
parasitic  
exists.

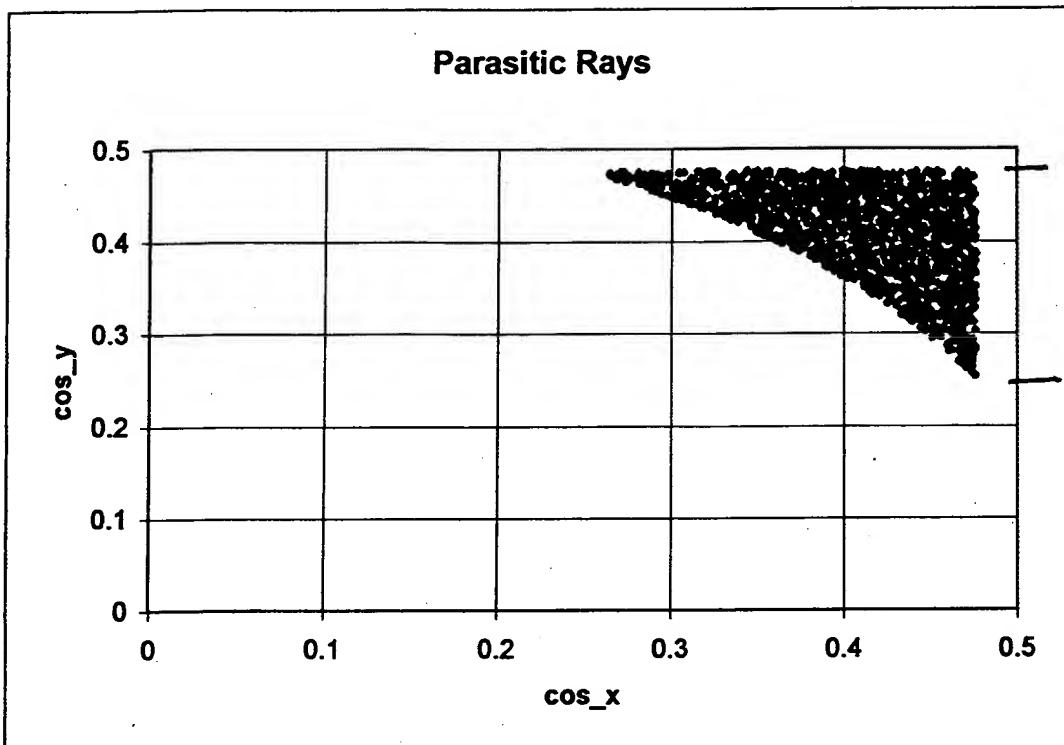

For  $n_c < \sqrt{n_s^2 - \frac{1}{2}}$   
this can be  
a zero-loss  
parasitic mode

For Parasitic Mode:

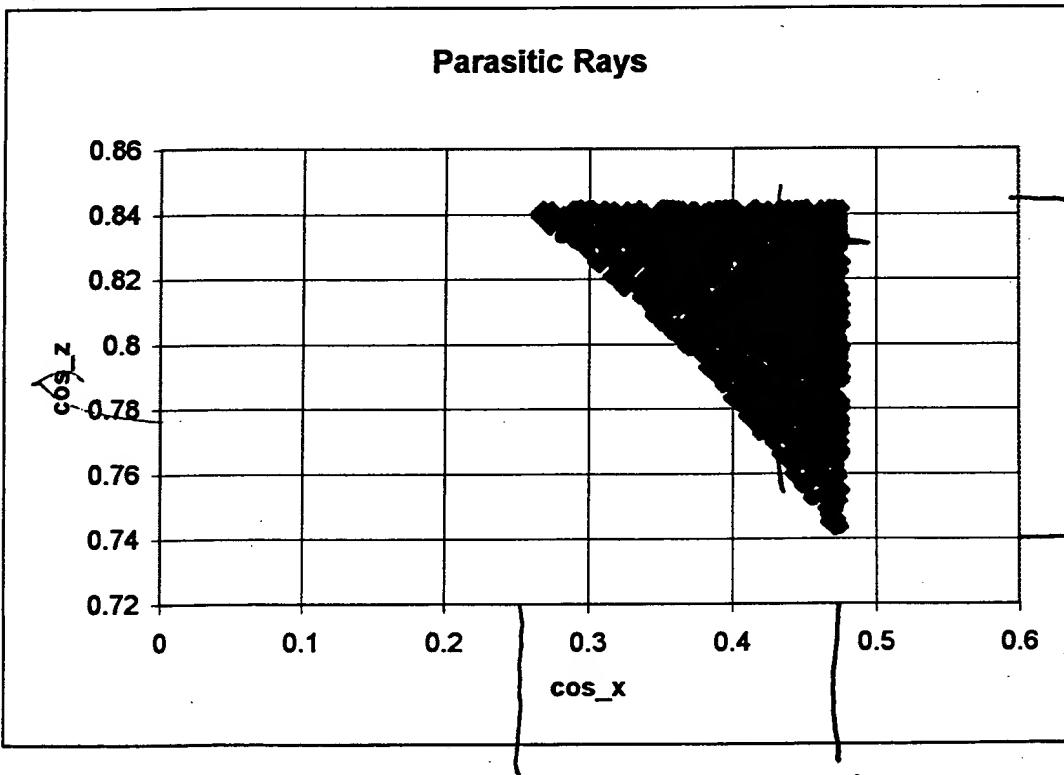

Average distance travelled between strikes on top and bottom  $\approx \frac{3.5\text{mm}}{.4} = 8.75\text{mm}$

Average distance travelled between strikes on left and right sides  $\approx \frac{2.5\text{mm}}{.4} = 6.25\text{mm}$

Average distance travelled between strikes on slab ends  $\approx \frac{10\text{cm}}{.82} = 12.2\text{cm}$

$0.47 \leftarrow \approx \theta_c$   
 $62^\circ$   
 $13^\circ$   
 $0.25$   
 $75^\circ$

$0.84 \leftarrow \approx \theta_c$   
 $32.6^\circ$   
 $10^\circ$   
 $0.740$   
 $42.30$

$0.25$   
 $0.47$   
 $75^\circ$   
 $13^\circ$   
 $62$   
 $\approx \theta_c$

```
